Title: New emission limit philosophy based on total number of solid particles in the size range 20-300 nm

Abstract: (max 200 words)
Studies published in recent years have shown that increased exposure to ultrafine particles (<0.1 µm) leads to impaired lung function in adults having asthma and increases the risk of heart attacks and premature death. The finer the particles, the greater the likelihood of inflammatory processes arising. Diesel cars contribute significantly to the emission of ultrafine particles. In consultation with the Swiss Federal Roads Office, the Swiss Agency for the Environment, Forests and Landscape has therefore decided that for reasons of public health, not only the mass, but also the number, of ultrafine solid particles emitted by combustion motors in the range of interest (20-300 nm) should be measured and controlled, and that appropriate action is needed to reduce them.

This paper presents the results of the current deliberations at the Swiss Agency for the Environment, Forests and Landscape concerning the introduction of a new emission limit value to reduce the risk to public health arising from diesel cars. The emphasis is on lowering the EURO 4 mass limit and supplementing it with a number limit. Diesel cars would only be able to comply with this where fitted with efficient particle filters.

Short CV
Dr. Manon Delisle is Head of the Transport Section of the Air Pollution Control and Non-Ionising Radiation Division of the SAEFL. She is concerned primarily with PM10 emission from road traffic and with measures to reduce it.

New Emission Limit Philosophy

based on the total number of solid particles
in the size range 20-300 nm

Paper by
Dr. Manon Delisle
Head of Traffic Section in the SAEFL
New Emission Limit Philosophy

Contents

1. Effects on health
2. Reduction potential of particle filters
3. New emission limit philosophy
4. Implementation and future perspectives
1. Health consequences of ultrafine particles
New Emission Limit Philosophy

- Origin of inflammatory processes
- Functional impairment of the lung
- Increased risk of heart attack
- Systemic effects in the whole body via the blood
- Carcinogenic effects
- Increase in sudden deaths
Conclusion 1
For health reasons it is important

• to measure
• to control
• to reduce
ultrafine solid particles

Current standpoint of the Swiss Agency for the Environment, Forests and Landscape (SAEFL) and the Federal Roads Office (FEDRO), March 2002
2. Reduction potential of particle filters
New Emission Limit Philosophy

Reduction potential of particle filters

VERT Particle Filter-Verification (all Systems after 1998)

Dr. Manon Delisle, Head of Traffic Section - 7th Internat. ETH Conference on Particles - 19 August 2003 - Zurich
New Emission Limit Philosophy

Reduction potential of particle filters
Particle number

Diesel emission with and without particle trap
vs. ambient air particle concentration

Comparison of diesel emissions measured at Biel TC on Liebherr 110 kW TDI Diesel with HJS-CRT filter, 1999

Dr. Manon Delisle, Head of Traffic Section - 7th Internat. ETH Conference on Particles - 19 August 2003 - Zurich
Good particle filters

- are state-of-the-art

- reduce > 98 % of the mass
  > 99 % of the number

as shown by the VERT effectiveness tests
## Progress in EURO particle emission standards

### Diesel cars:
- **EURO 3** (since 2001): 0.050 g/km
- **EURO 4** (effective 2006): 0.025 g/km
- **EURO 5**: does not yet exist

### Heavy motor vehicles:
- **EURO 3** (since 2001): 0.10 g/kWh
- **EURO 4** (effective 2006): 0.02 g/kWh
- **EURO 5** (effective 2009): 0.02 g/kWh
New Emission Limit Philosophy

Forecast for 2005
Redesign of motor in place of particle filter

DEUTZ BF 6 M 2013C - EURO 4
Particulate emission - comparison number - mass

Elemental carbon concentration mg/m³
Number concentration particle / cm³

EURO 4
EURO 3

Dr. Manon Delisle, Head of Traffic Section - 7th Internat. ETH Conference on Particles - 19 August 2003 - Zurich
Conclusion 2

The EURO emission limits do not fully exploit the technical reduction potential of particle filters in respect of:

- quality (ultrafine particles)
- quantity (reduction potential > 98%)
3.
New philosophy for particle emission limits
Current considerations of the SAEFL

- The emission of ultrafine particles must be minimised for health reasons.
- Particle filters are the best available technic for reducing their number and mass.
- The measure of the mass of particles has to be completed through the measure of the number.
- Highly sensitive instruments are available that measure the number of particles with the necessary precision.
New SAEFL philosophy for particle emission limits

**Mass**
Tightening of present emission limit for particle mass.

**Number**
Laying down of new particle emission limit based on the reduction potential of available particle filters.
New Emission Limit Philosophy

Standpoint of "Automobil Revue"

Quotations from AR no. 31, July 2003, p. 15

The editorial board of the "Automobil Revue" vigorously supports efforts aimed at reducing as far as possible the emission of particles in diesel exhaust.

If provisions describing the number, size distribution and surface properties of diesel particles would be of assistance in clarifying the present situation, a corresponding amendment to the exhaust gas regulations would be welcomed.
Knowledge gained from the ECE-GRPE particle measurement programme (PMP)

- Limitation of number and mass
- Size range 20-300 nm
- Assessment of solid particles alone
- Limit value should be based on the performance capabilities of modern particle filters
- Highly sensitive measuring equipment with the necessary precision is available
New Emission Limit Philosophy

Current considerations of the German Federal Agency for the Environment

New Emission Limit Philosophy

Number
Health-related emission limit for diesel cars (total, particle 20-300 nm)

- Without filter: $10^{14}$ P/km
- With filter: $< 10^{10}$ P/km
- Detection limit: $10^8$ P/km
- New emission limit: $10^{11}$ P/km
4. Implementation and future perspectives
Implementation in Switzerland

Building sites
Obligatory fitting of particle filters to:
• large machines at big building sites
• all machines at underground building sites

Busses
About 500 busses fitted with particle filters are now on the roads.
New Emission Limit Philosophy

Future objectives in Switzerland

Diesel cars

Opportunities to promote the introduction of diesel cars complying with the new emission limit:
• Obligation for all new diesel cars
• Import duty compensation scheme
• Combination of the above

=> All the above measures require a new emission limit and suitable measurement procedure.
Future objectives in Switzerland

Heavy motor vehicles

The Federal Council will hold negotiations with the EU concerning updating of the distance-dependent heavy vehicle tax (LSVA).

Objective: Lorries fitted with a particle filter should be assigned to the lowest LSVA category from 2005 onwards.

=> Here too, a new emission limit and suitable measurement procedure are required.
New Emission Limit Philosophy

International objectives

• Development of a particle counter in the GRPE PMP programme
• Definition of a health-risk-related number and mass emission limits in GRPE
• Adoption of these emission limits in EURO standards
New Emission Limit Philosophy

Many thanks for your attention
