
UFP and Black Carbon Emissions from Real World Wood Stoves without and with Electrostatic Precipitators

Dr. Axel Friedrich

What is the Problem with UFP from Wood Stoves

Yearly more than 63.000 premature death caused by $PM_{2,5}$ in Germany (EEA 2020)

Connection: Course of Covid-19 and by particle induced pre illnesses

Air pollution caused by wood stoves „under radar“:
Position of measurement stations and focus on larger particles. Nearly no stations measures UFP and Black Carbon.

Existing measurement stations: WHO AQG often exceeded.

Effects of Black Carbon on Climate, as compared to Greenhouse Gases

Global Warming Potentials (GWP)

Pollutants	GWP 20 years	GWP 100 years
Carbon dioxide	1	1
Carbon monoxide	18.6	5
Sulphur dioxide	-268	-71
Oxide of Nitrogen	-560	-149
Fossil methane	85	30
Nitrous oxide	264	265
Black carbon	3200	900
Organic carbon	-160	- 46

This report presents the results of a systematic review of evidence of the health effects of black carbon (BC). Short-term epidemiological studies provide sufficient evidence of an association of daily variations in BC concentrations with short-term changes in health (all-cause and cardiovascular mortality, and cardiopulmonary hospital admissions). Cohort studies provide sufficient evidence of associations of all cause and cardiopulmonary mortality with long-term average BC exposure. Studies of short-term health effects suggest that BC is a better indicator of harmful particulate substances from combustion sources (especially traffic) than undifferentiated particulate matter (PM) mass, but the evidence for the relative strength of association from long-term studies is inconclusive.

The main sources of BC are combustion engines (especially diesel), residential burning of wood and coal, power stations using heavy oil or coal, field burning of agricultural wastes, as well as forest and vegetation fires.

Emissions of BC from key sources in the EU-28;

Comparison: Current ecodesign standards vs. Blue Angel

		Ecodesign (firewood LSH)	Blue Angel
Limit values	PM	40 mg/m ³	15 mg/m ³
	PN	-	> 90 % reduction (< 3x10 ⁶ /cm ³)
	CO	1500 mg/m ³	500 mg/m ³
Test procedure		<ul style="list-style-type: none"> Ignition phase ignored Batch picking 	<ul style="list-style-type: none"> Ignition phase included All batches count
Exhaust cleaning		Not required	Required: <ul style="list-style-type: none"> Electrostatic precipitator (with counter of operating hours) Catalytic converter
Electronic combustion air controls		Only bonus (for efficiency)	No manual setting of combustion air allowed (-> mandatory)
Tightness (indoor poll.)		-	Additional test procedure

„Blue Angel“ Eco-Label for Wood Burning Stove

Interlaboratory Tests for PN Measurements

In the reports the results of the validation of the measurement procedure for the determination of the particle number of stove flue gas provided for in the Blue Angel award criteria for stoves are described. The aim of the validation was to determine the performance parameters of the measurement procedure by means of an interlaboratory test (proficiency test) and to identify necessary adaptations of the process specification. The investigations also served to examine the suitability of the limit value for PN emissions. As a result, it could be determined that the measurement procedure basically provides reliable and comparable measured values. The investigations were carried out on a test stand set up specifically for the project at the Hessian Agency for Nature Conservation, Environment and Geology (HLNUG) in Kassel.

Retrofit of Wood Stove Pilot Program

In Berlin a large pilot program started recently with the goal to retrofit up to 100 real world stove with electrostatic precipitators from four different manufactures in a small area in the Southwest of Berlin. The stoves were installed between 1998 and 2019. The three official chimney sweepers in the area support the project explicitly. On each stove measurements of ultra fine particle and black carbon emissions will be made after installation and after two years. For the UFP the test protocol of the German environmental label „ Blue Angel“ for wood stove are used. The first stove are installed in the mean time. The goal is to install the rest until the next heating period 2024.

Measurement of UFP: Sensors APA

PARTICLE NUMBER MEASUREMENT AUTOMOTIVE PARTICLE ANALYZER

The low-cost Automotive Particle Bench (APB[®]) is fully integrated into the Sensors' Automotive Particle Analyzer (APA) as a complete turnkey, easy-to-use Periodic Technical Inspection (PTI) particle number measuring instrument.

Specifications

- Analyzer Range: 0 up to 1,000,000 #/cm³; 0 up to 10,000,000 #/cm³ with optional secondary dilution
- Minimum Particle Size: d₅₀ approximately 23 nm; 10 nm optional upon request

Measurement Instruments (1)

Measurement of Black Carbon (BC): eBCMeter

- Stove emission passes filter paper
- Black Carbon (Soot) is deposited on/in the paper
- Photometer measures attenuation at 880nm
- Blackening is evaluated per script
- Data can be seen via interface

The measurement device was developed by Jonas Dahl and Axel Friedrich

Averages: 5053521 ng/m³_{avg12} » 3336210 ng/m³_{avgALL}
